

P1:

SIT313 Secure Frontend Applications

Personal Website –

DEV@Deakin – Short Report:

Student Name: Harshit Jindal

Student ID: 2510994815

Date: 21-08-2026

1. Introduction:

This task involved creating a website named DEV@Deakin using HTML, Tailwind CSS and JavaScript. The purpose of the DEV@Deakin website is to show my profile, projects and a small image gallery on a simple and responsive page. I also added a hover effect, on the banner and a JavaScript button that displays a thank-you message.

2. GitHub Link –

<https://github.com/harshit4815se25-max/P1--Personal-Website.git>

3. Navigation Bar and Banner:

The website begins with a bar at the top that goes from side to side. This bar has three links: About, Work and Contact. You can use these links to jump to different parts of the page. I placed a banner image below the navigation bar. When you move your mouse over the banner image, a message, with my name pops up on the screen.

[About](#) [Work](#) [Contact](#)

4. Author Profile:

In the Author Profile section I introduce myself as a Software Engineering student. I added my profile photograph and a short bit about my interests, in web development, programming and artificial intelligence.

5. Portfolio –

In my Portfolio section you can see three projects that show the programming and technology work I have done in the past. Every project includes an image, a project title and a short description. These projects show the things I have learned such, as IoT, web development and Arduino-based systems.

Portfolio

IoT Monitoring System

An IoT project using sensors to collect environmental information.

Student Registration Website

A beginner web project created using HTML, CSS and JavaScript.

Arduino Smart Lighting

An Arduino project using a button and LEDs to control smart lighting.

6. Gallery:

I looked at the Gallery section. Found six images that line up in a responsive grid. The Gallery images automatically change how they are arranged when the screen size changes. This makes the Gallery easier to view on devices.

Gallery

My Photos

7. JavaScript Interaction:

I used a JavaScript function to make the Contact section more interactive. When someone clicks the Contact Me button a browser alert pops up with a thank-you message. The JavaScript code is kept in its JavaScript file and linked to the HTML page using a script element.

8. Conclusion-

Overall, I built a **DEV@Deakin** website. It has a navigation bar, a banner, an author profile, a portfolio, a responsive gallery and a contact section. Working on this project let me practice the frontend technologies that are needed to build and showcase a personal web platform.
